MummyTKT's Bias Pointer

Strategy Rulebook

Every rule the platform uses to find a directional bias, confirm it and alert you — in plain words, with a picture for each.

Version: 25 October 2026 (script v10, Weekly = Daily rules) · matches the Bias Pointer script with Daily market structure (most recent External high / low), exact-level, bias-side H4 rejections (19 Oct 2026) and Entry Confirmations commit 882609e
This rulebook is the source of truth. When a rule changes, this document and the TradingView scripts change together.

How to read each rule

Each rule has a plain-words description, the exact condition for a **Buy** (bullish) and a **Sell** (bearish) setup side by side, a picture, and notes. Pictures show the buy side; the sell side is the mirror image. Green candles are up, red are down, dashed lines are levels, and blue bands are zones.

Contents

A. Candle basics
- Rule 1 — Bullish and bearish candles
- Rule 2 — Closes, not wicks

B. Formations (Daily and H4)
- Rule 3 — A-shape — resistance
- Rule 4 — V-shape — support
- Rule 5 — OC — Open/Close level

C. Daily bias
- Rule 6 — External high and low
- Rule 7 — Structures inside the range
- Rule 8 — Daily breakout
- Rule 9 — The Daily Breaker and moving away first
- Rule 10 — The Weekly storyline above the Daily
- Rule 11 — Weekly reaction → Daily breakout: the old A-shape (External)
- Rule 12 — Weekly reaction → Daily breakout: an A-shape made after the touch (Internal)
- Rule 13 — Weekly reaction → the existing External high breaks
- Rule 14 — Then the main External high breaks too

D. Daily reaction levels
- Rule 15 — Post-breakout Daily OC
- Rule 16 — What counts as a reaction
- Rule 17 — A reaction stays alive until it fails
- Rule 18 — Daily FVG
- Rule 19 — Daily FVG: which gap counts

E. H4 confirmation
- Rule 20 — The Origin alert
- Rule 21 — External and internal breaks

F. Continuations (after the Origin)
- Rule 22 — Every Daily reaction + H4 breakout
- Rule 23 — H4 Breaker retest
- Rule 24 — H4 OC continuation
- Rule 25 — Breakout continuation after a pullback
- Rule 26 — H4 engulfing
- Rule 27 — H4 FVG after breakout

G. A new breakout
- Rule 28 — When the setup changes

H. Entry patterns (H1 / H2)
- Rule 29 — PCL — sweep that holds
- Rule 30 — Engulfing Sweep — full engulf
- Rule 31 — When an entry alert fires

I. Timing and delivery
- Rule 32 — When alerts arrive
- Rule 33 — Who receives an alert

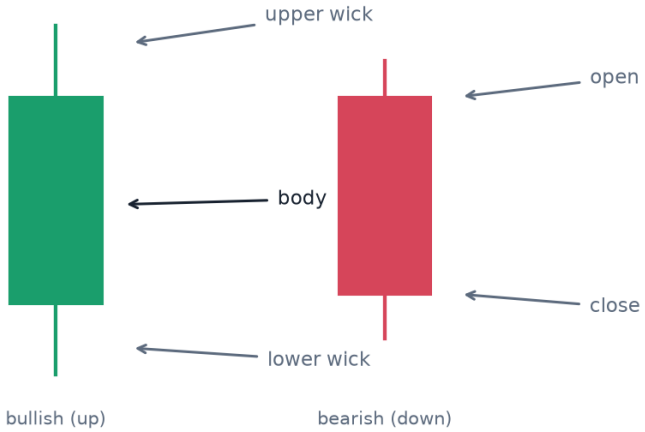

Glossary

A. CANDLE BASICS

Rule 1 — Bullish and bearish candles

A candle is **bullish** (up) when it closes at or above its open, and **bearish** (down) when it closes below its open. The **body** runs between open and close; the **wicks** are the high and low beyond the body.

Buy (bullish)	Sell (bearish)
Close ≥ open	Close < open

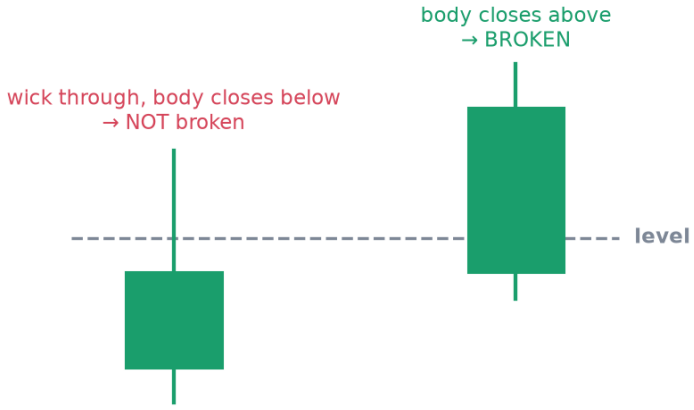

H4 levels and Daily levels (the External high and low, D.A, D.V and inside-range V/A-shapes) use candle **bodies**. The indicator setting **Daily levels from: Wick** switches the Daily levels back to wicks. Entry patterns are described in section H.

Rule 2 — Closes, not wicks

A level is only broken when a candle **body closes** beyond it. A wick that pokes through and closes back never counts as a break.

Buy (bullish)	Sell (bearish)
Broken when a candle closes above the level	Broken when a candle closes below the level

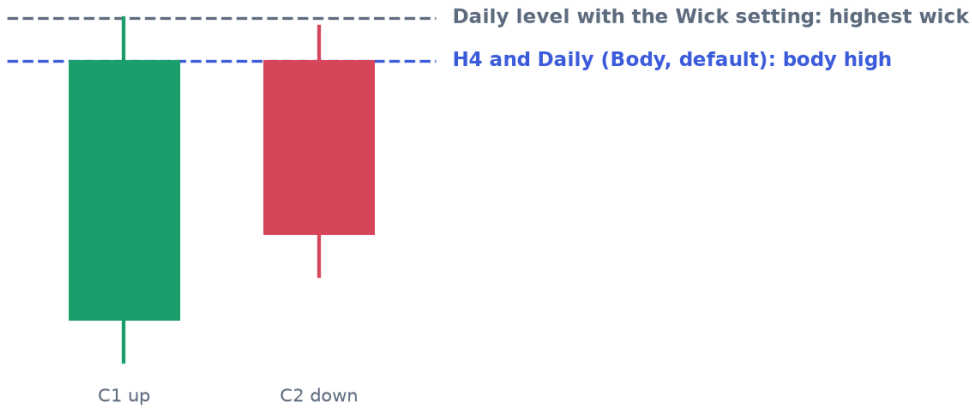

Confirmations are judged on **closed** candles only. A candle still forming can react, but it can't confirm.

B. FORMATIONS (DAILY AND H4)

Rule 3 — A-shape — resistance

An up candle followed immediately by a down candle. On **H4** the level is the **body high of the up candle**. On the **Daily** it is the **highest body top** of the two candles (the highest wick with the Wick setting).

Buy (bullish)	Sell (bearish)
Broken upward when a candle closes above it	In a sell bias the latest Daily one is shown as D.A

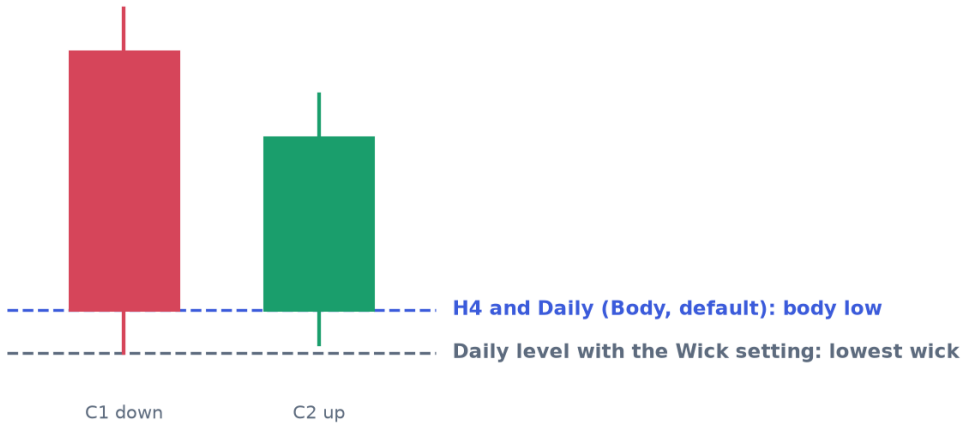

The level exists once the down candle has closed. The most recent A-shape is the one that counts.

Rule 4 — V-shape — support

A down candle followed immediately by an up candle. On **H4** the level is the **body low of the down candle**. On the **Daily** it is the **lowest body bottom** of the two candles (the lowest wick with the Wick setting).

Buy (bullish)	Sell (bearish)
In a buy bias the latest Daily one is shown as D.V	Broken downward when a candle closes below it

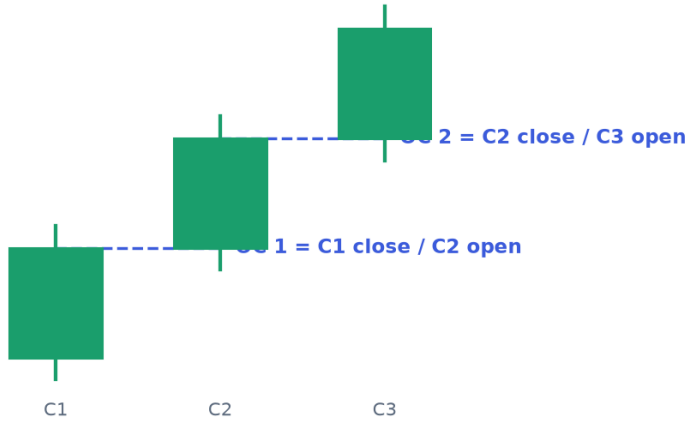

The level exists once the up candle has closed. The most recent V-shape is the one that counts.

Rule 5 — OC — Open/Close level

Two candles in a row in the same direction. The OC level is where the **first candle closed and the second opened**.

Buy (bullish)	Sell (bearish)
Two up candles in a row	Two down candles in a row

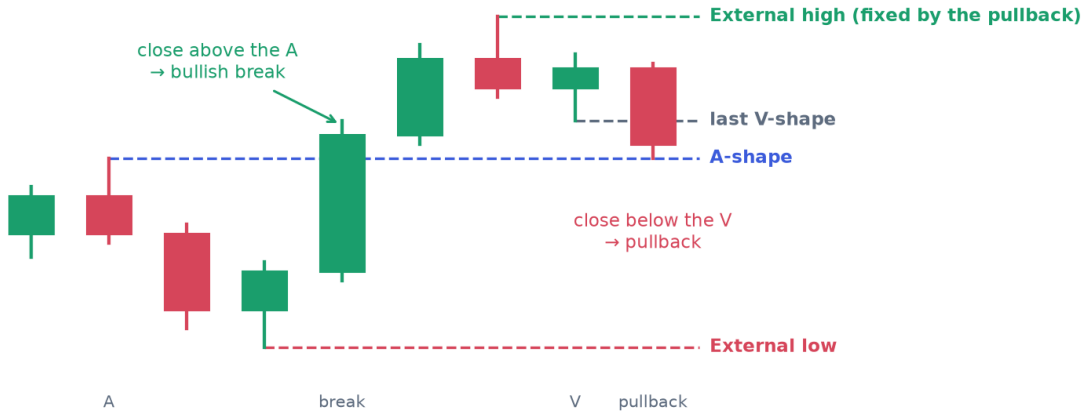

A run of three same-direction candles makes two OC levels (C1/C2 and C2/C3).

C. DAILY BIAS

Rule 6 — External high and low

The **external low** is the lowest body bottom between a Daily A-shape and the Daily candle that **closes above that A-shape's level** (the external high is the mirror). The side in the direction of the move **keeps following price** (“still forming”) until price pulls back by closing beyond the last A/V-shape it came from; then it is fixed.

Buy (bullish)	Sell (bearish)
Bullish: the external low is fixed; the external high follows new highs until a Daily close below the last V-shape	Bearish: the external high is fixed; the external low follows new lows until a Daily close above the last A-shape

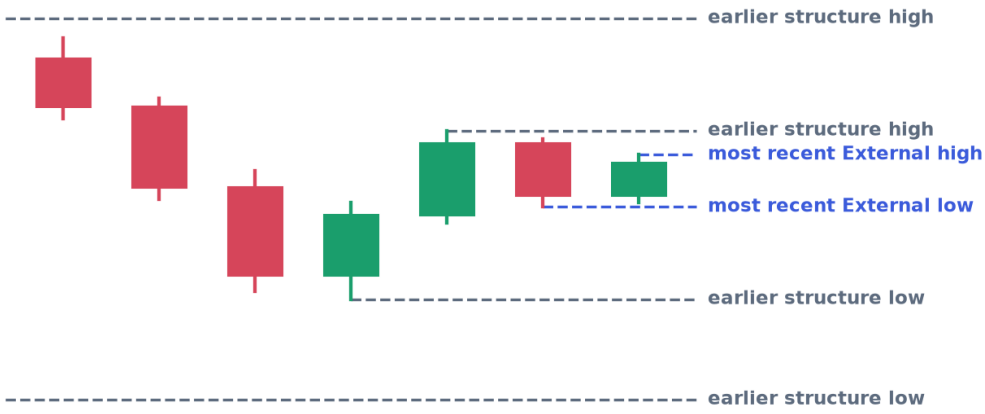

A Daily close beyond the fixed level makes a new pair in the same direction. A close beyond the other level flips the direction.

Rule 7 — Structures inside the range

While price is inside the current range, a **new structure can form inside it** by the same rules — a swing only counts once a later candle has traded beyond the candle that formed the A/V-shape (below the A's down candle, above the V's up candle) before the break. The new one becomes the **most recent External high and low**. This can repeat at any depth.

Buy (bullish)	Sell (bearish)
When the most recent structure breaks, every structure inside it is dropped and the one around it counts again	The Bias Pointer draws only the most recent pair, e.g. “Bullish External low” or “Bearish External low (still forming)”

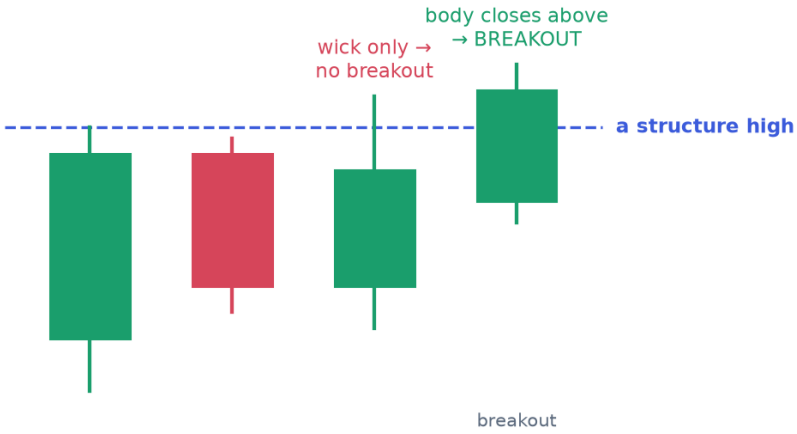

A close beyond an older, wider level is also beyond every newer one inside it, so the most recent pair is always the first to break.

Rule 8 — Daily breakout

A Daily candle **body closes beyond the most recent External high or low**. No tolerance is used for this. The **most recent break on any layer** sets the direction of the bias, and the level it broke is the Daily Breaker.

Buy (bullish)	Sell (bearish)
Daily close above the most recent External high	Daily close below the most recent External low

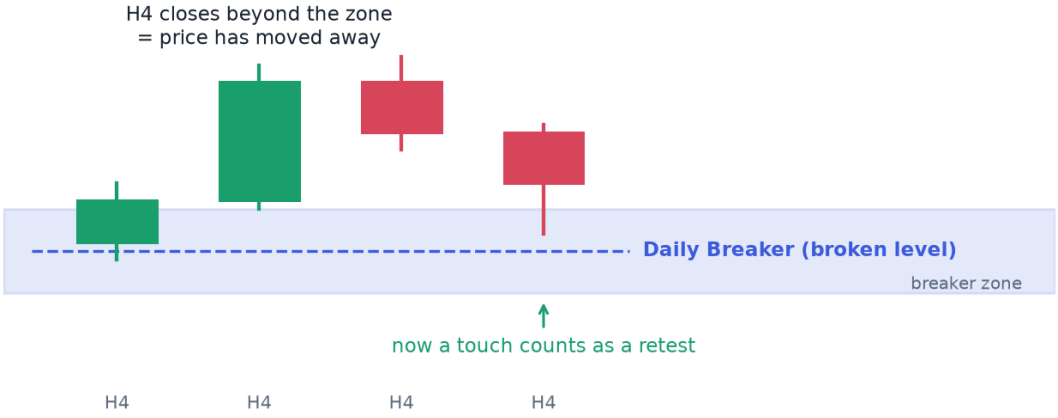

A wick through a level is not a break. The breakout alone is not a trade signal — it starts the setup. A wick through a level is not a break. The breakout alone is not a trade signal — it starts the setup.

Rule 9 — The Daily Breaker and moving away first

The broken level becomes the **Daily Breaker**: former resistance becomes support (or the reverse). Its zone is the level ± 5 pips. Before any retest counts, price must have **moved away**: the Daily breakout candle itself closed beyond the zone, or a later H4 candle closes beyond it.

Buy (bullish)	Sell (bearish)
An H4 close above the breaker zone, then a later dip back into it	An H4 close below the breaker zone, then a later rise back into it

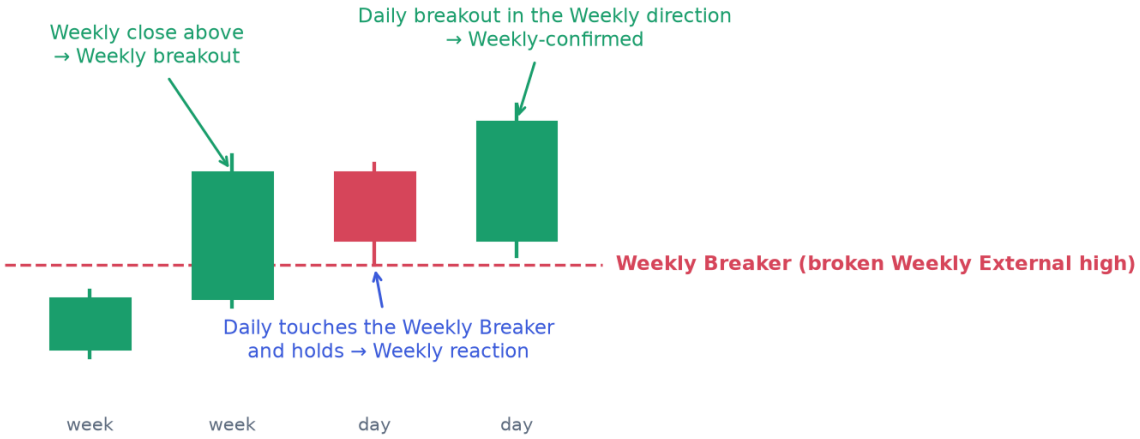

This stops a breakout that is still sitting on its level from counting as a retest straight away. The chart label says “price hasn't moved away from the breakout yet” while this is what's holding a reaction back.

Rule 10 — The Weekly storyline above the Daily

The Daily rules one level up. The **Weekly External high/low** is built on Weekly candles (with its own **Weekly levels from: Body / Wick** setting); a **Weekly close** beyond it is a Weekly breakout, and its own close beyond the Breaker counts as moving away. **Daily candles** then react at Weekly levels — post-breakout Weekly OCs, Weekly V/A-shapes formed after the breakout, **Weekly FVGs**, the Weekly Breaker, and Weekly V/A-shapes, OCs and FVGs inside the broken Weekly range — with an exact Daily wick touch that holds. The **first Daily touch** of a Weekly level decides External / Internal: a **Daily breakout in the Weekly direction is Weekly-confirmed**, External if the Daily level it broke formed before that touch, Internal if after. Weekly FVGs follow every Daily FVG rule (dip in from above, only a Weekly close kills one, each deeper Weekly candle restarts the check, a deeper FVG takes over, the ones price went through are used up). A Weekly-confirmed Daily breakout uses up that Weekly reaction. The Weekly never fires an alert: it labels the setup.

Buy (bullish)	Sell (bearish)
Weekly breakout up, Daily touches a Weekly level and holds, then a Daily breakout up	Weekly breakout down, Daily touches a Weekly level and holds, then a Daily breakout down

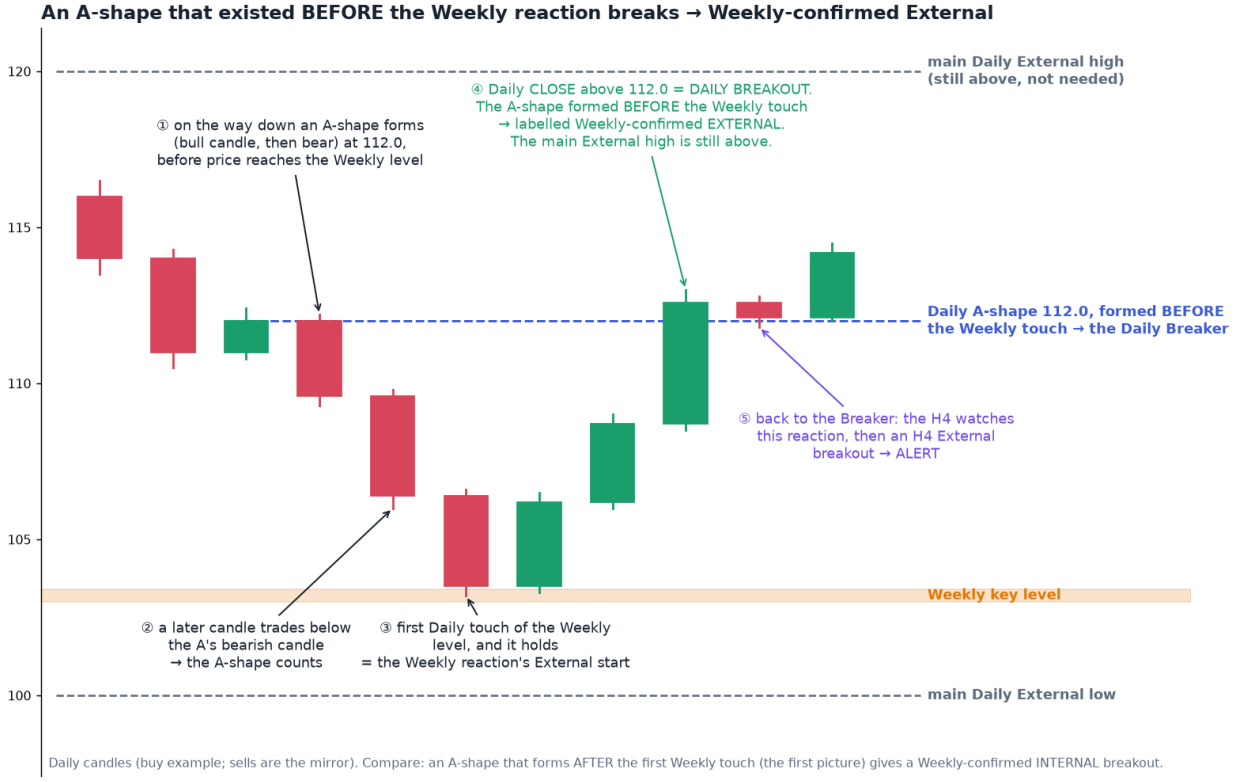

A Daily close through the reacting Weekly level ends the Weekly link; a new Weekly breakout starts again. A Daily setup against the Weekly direction still alerts, marked AGAINST the Weekly. With no Weekly setup, the Daily rules work exactly as before.

Rule 11 — Weekly reaction → Daily breakout: the old A-shape (External)

An existing Daily External high/low does **not** have to break. Price falls inside the existing range and a Daily wick touches a **Weekly key level** and holds: the **first touch** is the Weekly reaction's start. An A-shape that formed on the way down, **before** that touch (and counts: a later candle traded below its bearish candle), is then closed above by a Daily candle. That close is a **Daily breakout** (a new, smaller structure inside the old range), labelled **Weekly-confirmed External**.

Buy (bullish)	Sell (bearish)
Buys: the broken A-shape formed before the first Weekly touch → Weekly-confirmed External	Sells: the broken V-shape formed before the first Weekly touch → Weekly-confirmed External

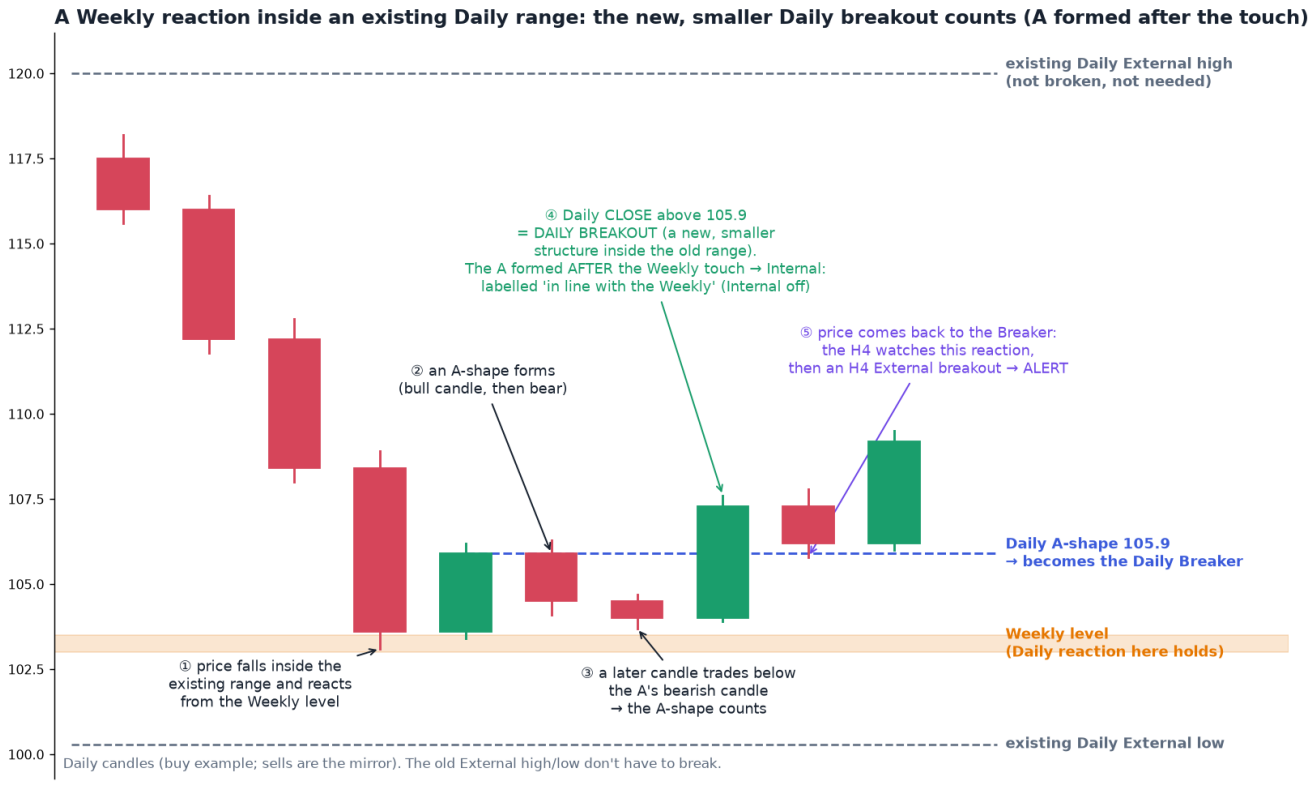

The A-shape becomes the Daily Breaker: the H4 watches the reaction there, then an H4 External breakout sends the Origin alert. This Weekly-confirmed breakout uses up that Weekly reaction.

Rule 12 — Weekly reaction → Daily breakout: an A-shape made after the touch (Internal)

Same start, but the A-shape that breaks formed **after** the first Weekly touch. It is still a **Daily breakout**, and the H4 watches its Breaker as usual. Its Weekly label is **Internal**: with Internal off (the default) it is shown as **in line with the Weekly**, and the Weekly reaction stays alive, waiting for an External break.

Buy (bullish)	Sell (bearish)
Buys: A-shape formed after the first Weekly touch → Internal (in line while Internal is off)	Sells: V-shape formed after the first Weekly touch → Internal (in line while Internal is off)

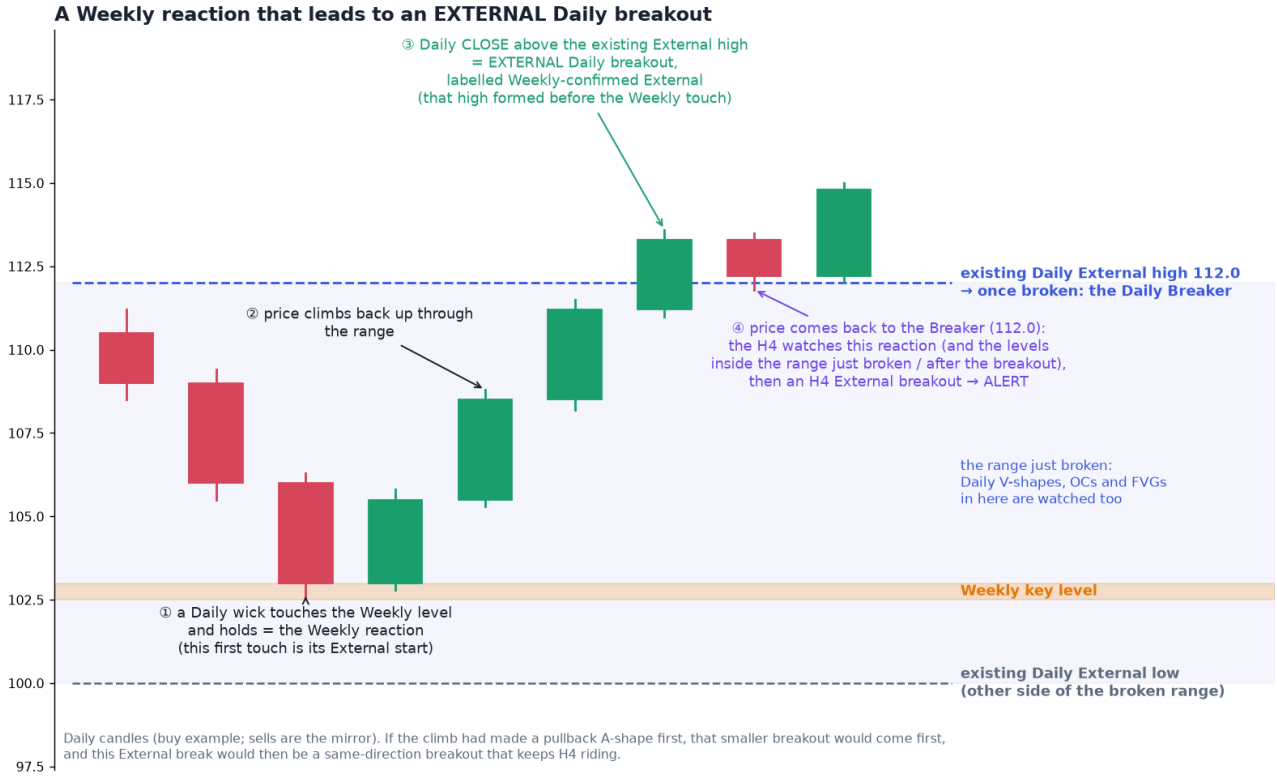

The breakout and its alerts are not blocked: only the Weekly label differs.

Rule 13 — Weekly reaction → the existing External high breaks

If the climb from the Weekly level makes no smaller structure first, the Daily close above the **existing External high** is the Daily breakout. That high formed before the Weekly touch, so it is **Weekly-confirmed External**. The old high becomes the Daily Breaker, and the range just broken (down to the External low) holds the Daily levels watched for reactions.

Buy (bullish)	Sell (bearish)
Buys: Daily close above the existing External high after a Weekly reaction	Sells: Daily close below the existing External low after a Weekly reaction

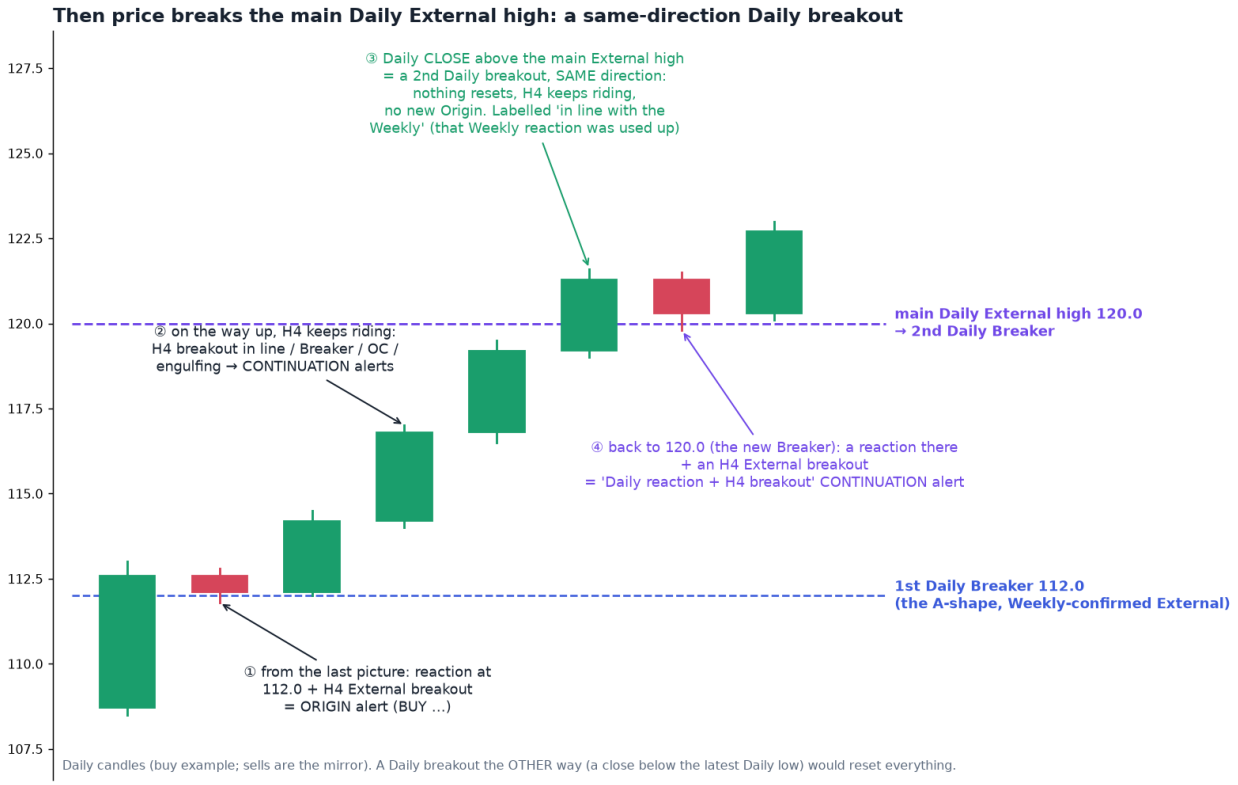

If the climb had made a pullback A-shape first, that smaller breakout comes first and this one follows as a same-direction breakout.

Rule 14 — Then the main External high breaks too

After a Weekly-confirmed Daily breakout and its Origin, price can go on to close above the main Daily External high. That is a **second Daily breakout in the same direction**: nothing resets, H4 keeps riding, and there is **no new Origin**. Its Weekly label is **in line** (the Weekly reaction was used up) unless a fresh Weekly reaction came first. The main high becomes the new Daily Breaker; a reaction there plus an H4 External breakout sends a **“Daily reaction + H4 breakout”** continuation.

Buy (bullish)	Sell (bearish)
Buys: Daily close above the main External high → same-direction breakout, H4 keeps riding	Sells: Daily close below the main External low → same-direction breakout, H4 keeps riding

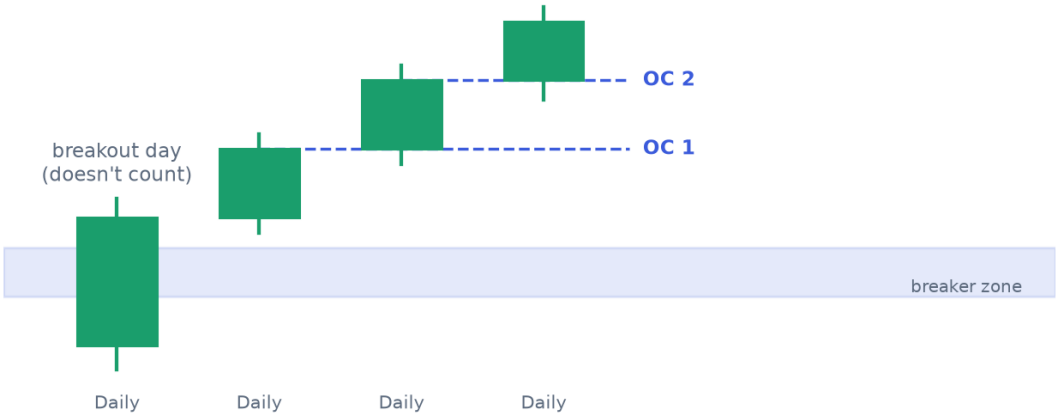

A Daily breakout the other way resets everything (a new Origin when it confirms).

D. DAILY REACTION LEVELS

Rule 15 — Post-breakout Daily OC

After the breakout day, Daily candles that keep closing in the breakout direction, beyond the breakout level, form OCs. **Every completed OC** is watched until an opposing breakout.

Buy (bullish)	Sell (bearish)
Two up Daily candles in a row, both closing above the breakout level	Two down Daily candles in a row, both closing below the breakout level

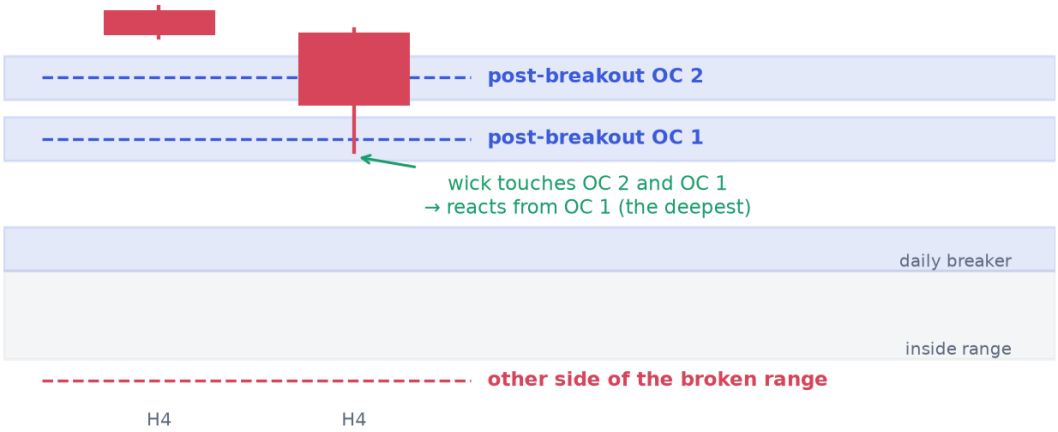

The breakout candle itself doesn't count as candle 1. An OC must sit clear of the breaker zone (beyond ± 5 pips). The chart label shows the newest one, e.g. “D.OC 10704.99 (3 watched)”.

Rule 16 — What counts as a reaction

An H4 candle reacts from a zone when its **wick reaches the level exactly** (a near miss doesn't count) and its close doesn't go through it. Zones are checked in this order:

Buy (bullish)	Sell (bearish)
1) the deepest post-breakout OC touched · 2) a Daily V-shape formed after the breakout · 3) a bullish Daily FVG after the breakout · 4) the Daily Breaker · 5) a Daily V-shape or Daily bullish OC level inside the range that was just broken · 6) a bullish Daily FVG inside that range	1) the highest post-breakout OC touched · 2) a Daily A-shape formed after the breakout · 3) a bearish Daily FVG after the breakout · 4) the Daily Breaker · 5) a Daily A-shape or Daily bearish OC level inside the range that was just broken · 6) a bearish Daily FVG inside that range

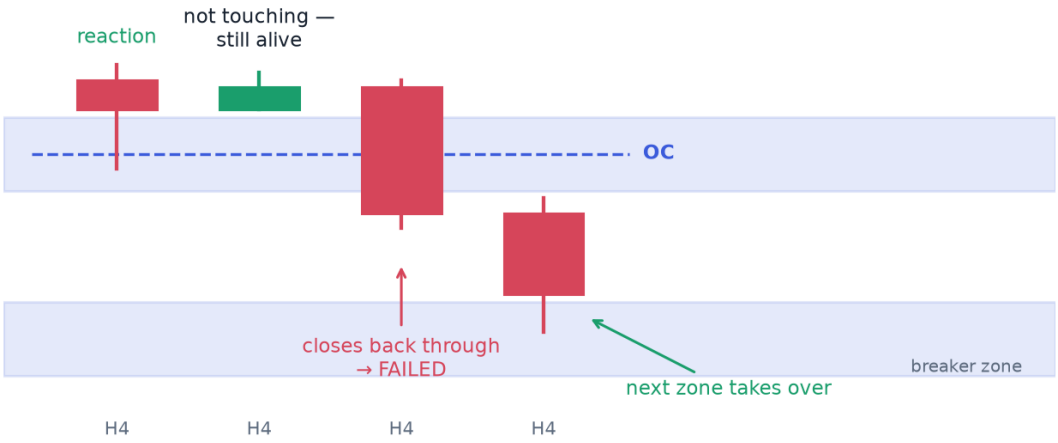

A Daily level only exists once the Daily candle that forms it has closed; the candles that formed it can't react to it. The reaction is reported with its source and level. Simply being back inside the range is not a reaction. It doesn't matter which zone price reaches first. A Daily level is dead once a Daily candle closes through it (below a buy level, above a sell level) and never counts again.

Rule 17 — A reaction stays alive until it fails

Once price has reacted, the reaction stays valid on **later candles**. It only **fails** when an H4 candle closes back through the zone on the wrong side. Then the next zone price reaches takes over.

Buy (bullish)	Sell (bearish)
Fails on an H4 close below the zone (the level − 5 pips, or the breaker zone)	Fails on an H4 close above the zone (the level + 5 pips, or the breaker zone)

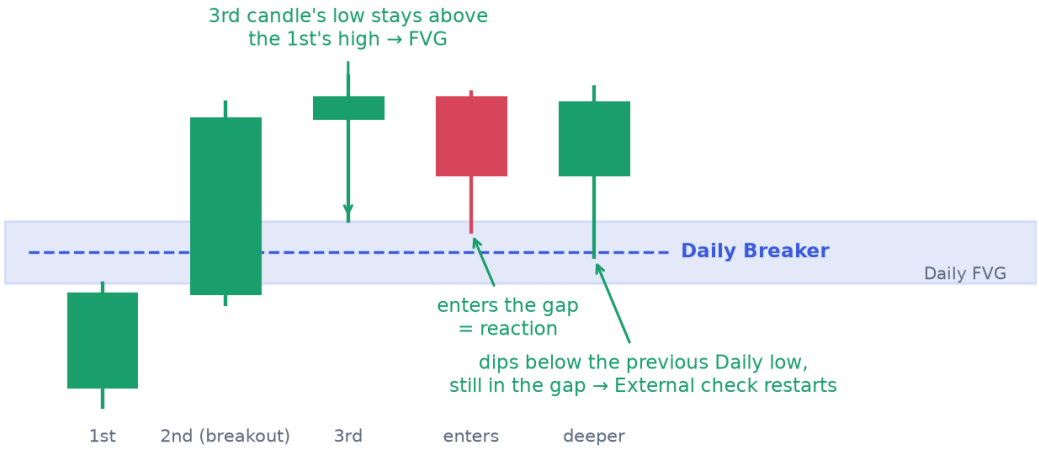

A candle that simply doesn't touch the zone any more does NOT cancel the reaction. A Daily FVG reaction is different: only a Daily close through the gap ends it.

Rule 18 — Daily FVG

Three Daily candles where the **third closes without reaching the first** leave a gap: a **Daily FVG**. It only exists once that third candle has closed; the middle one can be the Daily breakout candle. One reaching beyond the Daily Breaker is a **Daily FVG after the breakout**; one fully inside the broken range is a **Daily FVG inside the range**. An H4 wick **entering the gap** is a reaction.

Buy (bullish)	Sell (bearish)
Bullish FVG: the 3rd candle's low stays above the 1st candle's high (buy reactions)	Bearish FVG: the 3rd candle's high stays below the 1st candle's low (sell reactions)

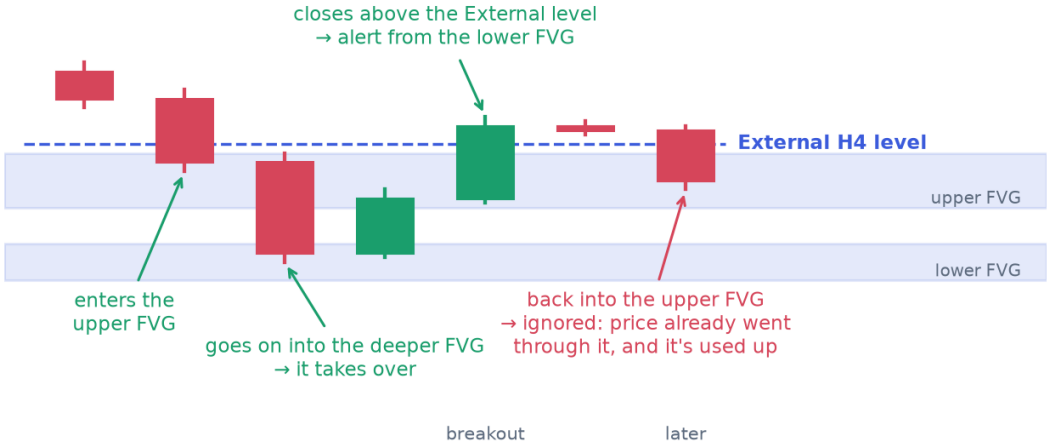

Only a **Daily close through the gap** kills it; a wick past its far edge doesn't. Because it is a zone, each Daily candle that dips below the previous Daily low while price reacts inside it (above the high, for sells) **restarts the External check** from when that candle entered the gap. Every other Daily level keeps the first-touch rule.

Rule 19 — Daily FVG: which gap counts

A bullish FVG only reacts when price **dips into it from above** (a bearish one from below). Once price has traded past the gap's far edge, it can't start a new reaction: coming back into it from the other side is ignored. While price reacts at one FVG and goes on into a **deeper FVG**, the deeper one takes over, with its own External level.

Buy (bullish)	Sell (bearish)
Buys: dip into a bullish gap from above; a deeper bullish gap below takes over	Sells: rise into a bearish gap from below; a higher bearish gap above takes over

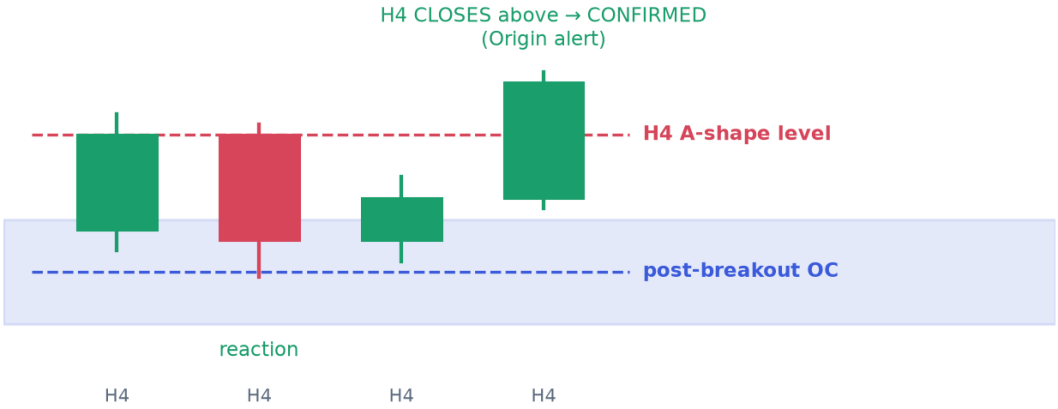

Each FVG keeps its own External level (from the candle that first entered it, moved by each deeper Daily candle while it is the reaction), so a return to it uses that level. An H4 breakout from an FVG **uses up** the FVGs above it (below, for sells) that price went through.

E. H4 CONFIRMATION

Rule 20 — The Origin alert

While a reaction is alive, an H4 candle **closes beyond the External H4 A-shape** (buy) or **V-shape** (sell) of that reaction. It can be **any later candle**, not only the one that reacted. The first confirmation of a Daily breakout is the **Origin**.

Buy (bullish)	Sell (bearish)
H4 close above the External H4 A-shape level	H4 close below the External H4 V-shape level

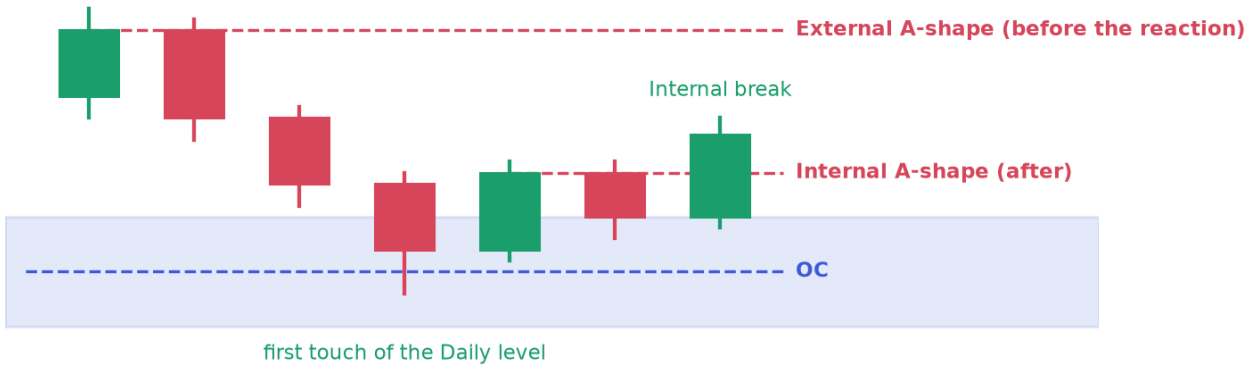

The candle that forms an A/V-shape can't also break it. The alert names the reaction source and the H4 level broken.

Rule 21 — External and internal breaks

What counts is the **first H4 touch** of a Daily level after that level formed. The **External** level is the closest H4 A-shape (buy) or V-shape (sell) that formed **before** that first touch. Every A/V-shape that forms **after** the touch is **Internal**, however deep price goes. The first touch of a **new** Daily level starts its own check, even while price is reacting at another level.

Buy (bullish)	Sell (bearish)
External: the closest A-shape before the first touch · Internal: any A-shape formed after it	External: the closest V-shape before the first touch · Internal: any V-shape formed after it

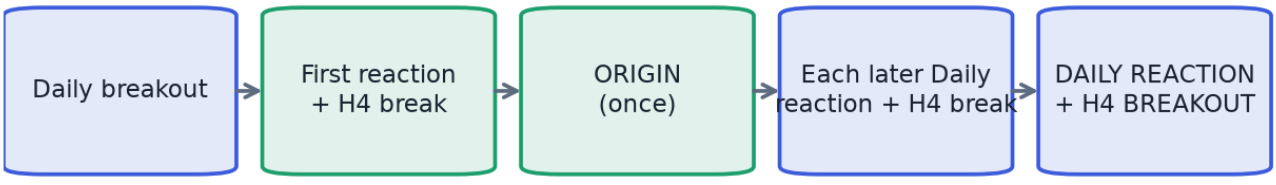

With Internal off (the default), breaking only an Internal level does not use up the reaction: the script keeps waiting for the External one. Daily FVGs are the one exception: the check moves with each deeper Daily candle inside the gap (see Daily FVG).

F. CONTINUATIONS (AFTER THE ORIGIN)

Rule 22 — Every Daily reaction + H4 breakout

There is one Origin per Daily breakout. After it, **every fresh reaction at a Daily level followed by an H4 External breakout** sends a **“Daily reaction + H4 breakout”** alert, also while H4 is still in line. While H4 is in line, every new H4 close beyond the **latest** H4 A-shape (buy) or V-shape (sell) also sends an **“H4 breakout in line with the Daily”** alert; no Daily reaction is needed for it.

Buy (bullish)	Sell (bearish)
Continuations keep firing in the buy direction	Continuations keep firing in the sell direction

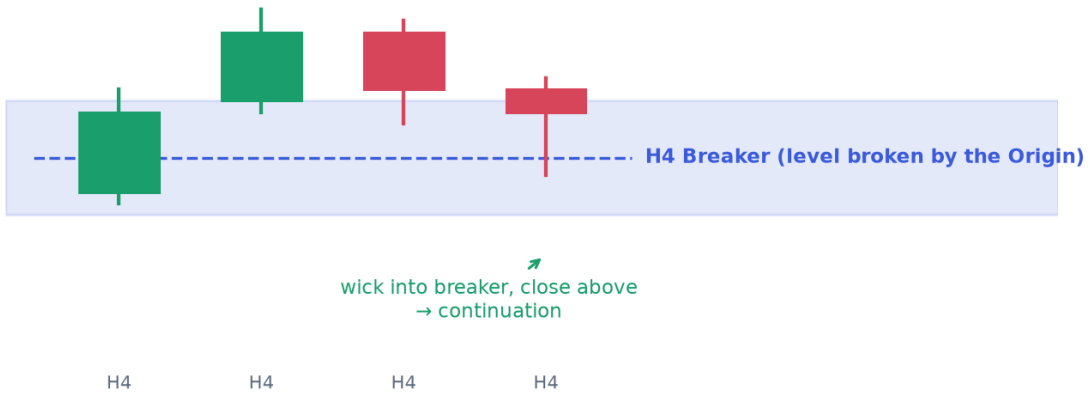

Continuations follow the setup's latest H4 confirmation: with Internal off, continuations of an Internal setup are not sent.

Rule 23 — H4 Breaker retest

The H4 level broken by the Origin becomes the **H4 Breaker**. Each newer in-line H4 breakout (and a return in line) replaces it with the level it broke. When a later H4 candle **wicks exactly onto it and closes beyond it** in the bias direction, a continuation fires.

Buy (bullish)	Sell (bearish)
Candle opens at/above the H4 breaker, wicks into it, closes above it	Candle opens at/below the H4 breaker, wicks into it, closes below it

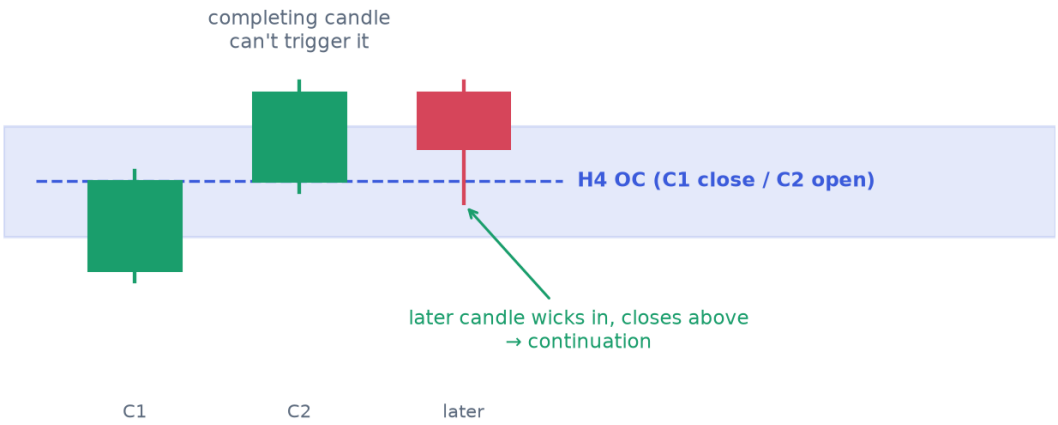

The first one at each H4 Breaker is labelled “Breaker origin”, later ones “Breaker continuation”. Each visit alerts once; price must leave the zone before the next.

Rule 24 — H4 OC continuation

Two H4 candles in a row in the bias direction form an **H4 OC**. After each H4 breakout in the bias direction, **every OC of that breakout's leg** (from its swing low, or swing high for sells) and every OC formed after it is watched. When a **later** H4 candle wicks exactly onto one and closes beyond it, a continuation fires and that OC is used up.

Buy (bullish)	Sell (bearish)
Candle opens at/above the H4 OC, wicks into it, closes above it	Candle opens at/below the H4 OC, wicks into it, closes below it

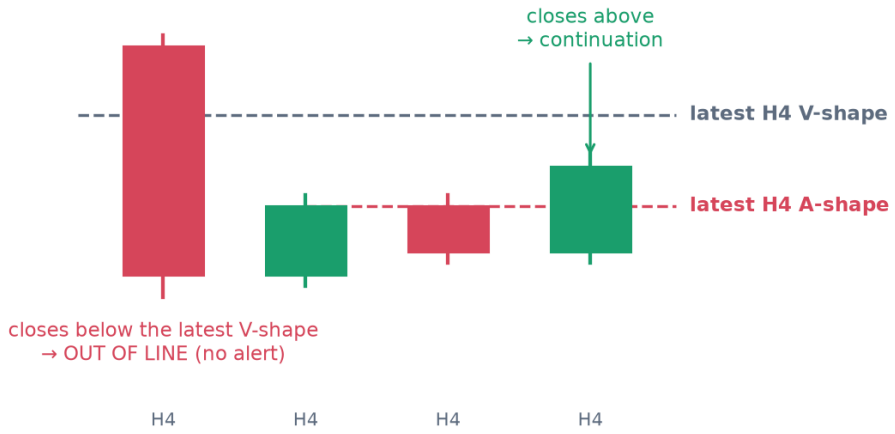

The candle that completes the OC can't trigger it, and a candle climbing up through it from below (falling through it from above, for sells) is not a rejection. If one candle rejects several OCs, one alert names the furthest and all of them are used up. An OC closed through against the bias is dropped. A newer H4 breakout keeps only its own leg's OCs; an H4 break the other way or a new Daily breakout drops them all.

Rule 25 — Breakout continuation after a pullback

If an H4 candle closes against the bias beyond the **latest** H4 V-shape (buy) or A-shape (sell), H4 is **out of line** (the chart label says OUT OF LINE) and every H4 OC is dropped. To come back in line, price must first **react at a Daily level again** (the Daily Breaker, a Daily V/A-shape or OC inside the range, or a post-breakout Daily OC — same rules as before the Origin). Then an H4 close beyond the latest H4 A/V-shape in the bias direction fires the continuation, naming that Daily level, and OC tracking starts fresh.

Buy (bullish)	Sell (bearish)
Out of line on a close below the latest H4 V-shape; back in after a Daily reaction plus a close above the latest H4 A-shape	Out of line on a close above the latest H4 A-shape; back in after a Daily reaction plus a close below the latest H4 V-shape

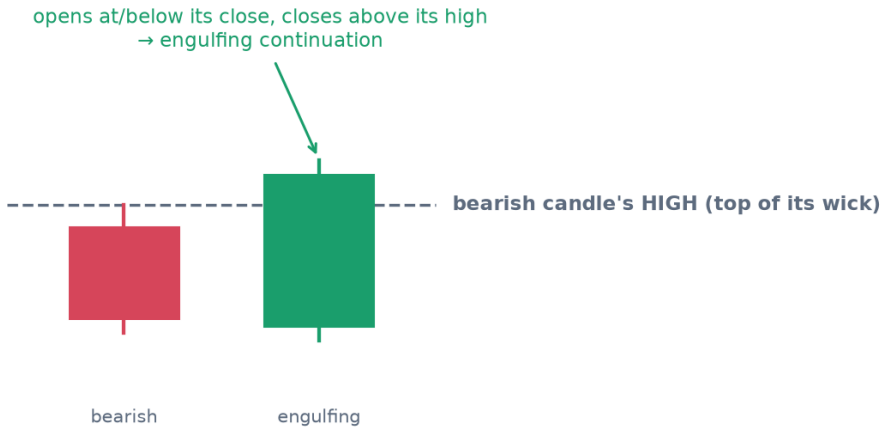

Going out of line sends no alert. While out of line no H4 OC or H4 Breaker alerts fire, and the dashboard shows the pair as OUT OF LINE.

Rule 26 — H4 engulfing

After the Origin and while H4 is in line, an H4 candle that **covers the previous opposite candle's body**, in the Daily direction, sends an engulfing continuation, marked **covers the wick** when it also closes beyond that candle's high (low for sells). Each member chooses which reach them: covers the wick (default), covers the body only, or both.

Buy (bullish)	Sell (bearish)
After a bearish candle: opens at/below its close, closes above its open (body) or above its HIGH (wick)	After a bullish candle: opens at/above its close, closes below its open (body) or below its LOW (wick)

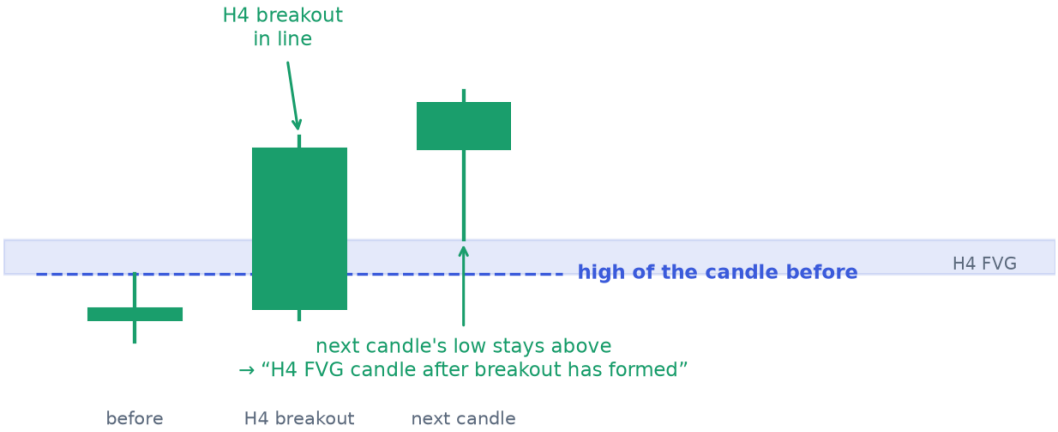

One alert per candle: if a Breaker, OC or in-line breakout alert fires on the same candle, the engulfing alert is not sent.

Rule 27 — H4 FVG after breakout

After an **Origin**, a **Daily reaction + H4 breakout**, **H4 back in line** or an **H4 breakout in line**, the **next H4 candle** is checked once. If it completes an FVG, one alert is sent with only the pair and **“H4 FVG candle after breakout has formed”**. It is a liquidity marker, not a buy or sell signal.

Buy (bullish)	Sell (bearish)
Buys: the next candle's low stays above the high of the candle before the breakout	Sells: the next candle's high stays below the low of the candle before the breakout

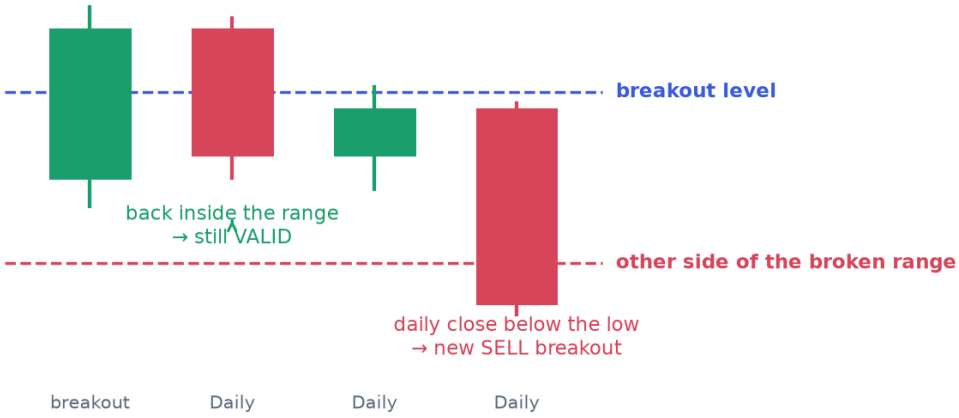

Checked only on that one candle: if it doesn't form an FVG, nothing more until the next H4 breakout. Breaker, OC and engulfing alerts don't trigger it. Off for subscribers unless they switch it on in Alert Filters; it follows the setup's External / Internal like other continuations.

G. A NEW BREAKOUT

Rule 28 — When the setup changes

Pulling back into the range is not a cancellation — that's where reactions happen. A new Daily breakout in the **same** direction keeps H4 riding: in-line breakouts and H4 reactions keep firing, and a reaction at the new breakout's levels plus an H4 breakout becomes what H4 rides on. A Daily breakout the **other** way resets everything.

Buy (bullish)	Sell (bearish)
A Daily close below the other side of the broken range (or any lower low) starts a sell setup	A Daily close above the other side of the broken range (or any higher high) starts a buy setup

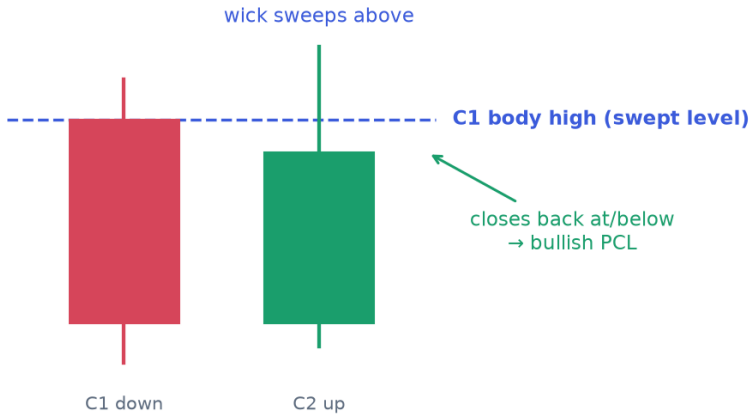

There is no separate invalidation any more: a break the other way replaces the setup.

H. ENTRY PATTERNS (H1 / H2)

Rule 29 — PCL — sweep that holds

A two-candle pattern measured on the previous candle's **body edge**. The new candle's wick sweeps past it, but its body closes back inside.

Buy (bullish)	Sell (bearish)
Down candle, then up candle: its high goes above C1's body high, and it closes at or below that body high	Up candle, then down candle: its low goes below C1's body low, and it closes at or above that body low

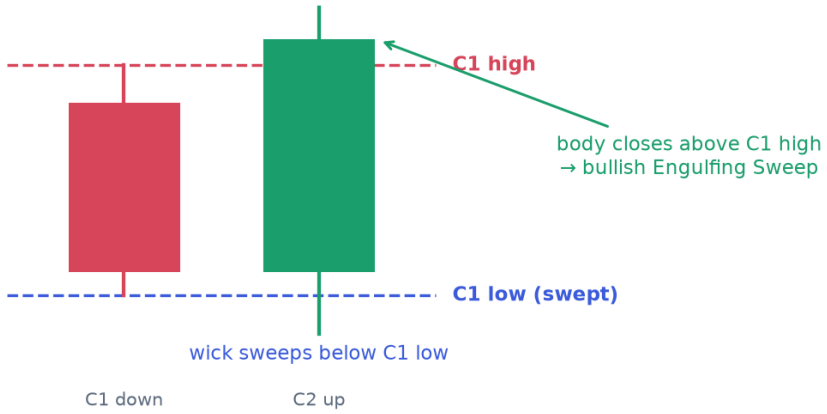

The two candles must be opposite colours. Fires on candle close.

Rule 30 — Engulfing Sweep — full engulf

Measured on the previous candle's **full high and low**. The new candle's wick sweeps one extreme, and its body closes beyond the other.

Buy (bullish)	Sell (bearish)
Down candle, then up candle: wick below C1's low, body closes above C1's high	Up candle, then down candle: wick above C1's high, body closes below C1's low

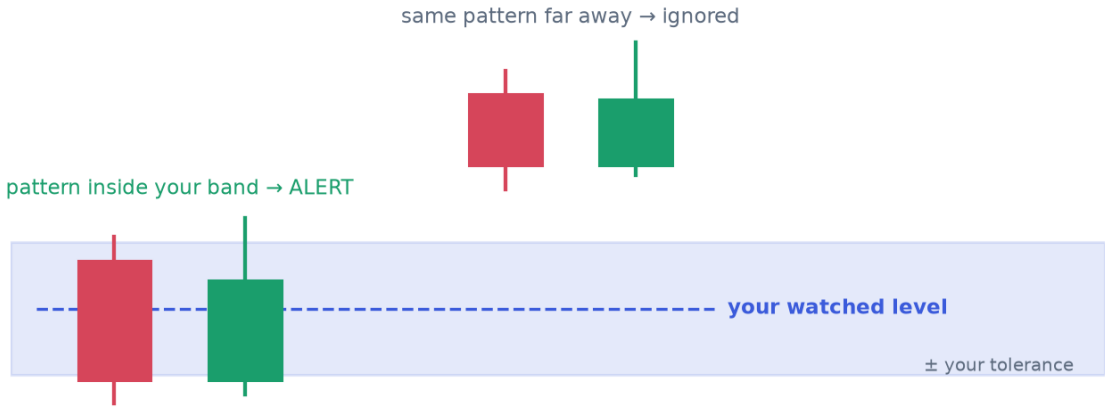

The two candles must be opposite colours. Fires on candle close.

Rule 31 — When an entry alert fires

Entry patterns only alert at a level **you chose** in Price Alerts → Entry Pattern Alerts: same direction, and the pattern's close within your tolerance (default 20 pips). The alert fires once, then closes.

Buy (bullish)	Sell (bearish)
Set a Buy entry alert at your level	Set a Sell entry alert at your level

Entry alerts don't check the bias state — you decide when and where to watch.

I. TIMING AND DELIVERY

Rule 32 — When alerts arrive

Everything is judged at **candle close**. H4 candles on forex.com close at 2am, 6am, 10am, 2pm, 6pm and 10pm (Nigeria time); alerts arrive within moments of the close.

Buy (bullish)	Sell (bearish)
Forex and metals: Sunday 10pm to Friday 10pm (Nigeria time)	Crypto: around the clock

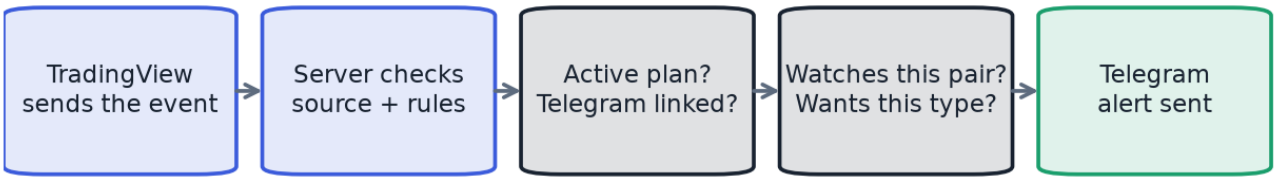

When US clocks change in November, all these times move one hour later.

Rule 33 — Who receives an alert

An alert reaches a member only if their plan is active, their Telegram is linked, they follow that pair (Settings → My Instruments), and they allow that alert type in Alert Filters (Origin, each continuation type including “Daily reaction + H4 breakout”, engulfing; External / Internal). Continuations follow the setup's latest H4 confirmation: with Internal off, an Internal setup sends none.

Buy (bullish)	Sell (bearish)
Buy and Sell alerts follow the same rules	Every type is on until switched off, except Internal H4 breakouts (off until switched on)

Members without Telegram linked still see every alert on the dashboard and in History.

Glossary

Bias	The direction (buy or sell) the Daily breakout sets.
Breakout	A Daily candle body closing beyond the most recent External high (buy) or low (sell).
External high / low (Daily)	The most recent structure's high and low. Smaller structures can form inside the range at any depth; the newest one counts.
Daily Breaker	The broken level, now acting as support (buy) or resistance (sell).
OC	Open/Close level: where the first of two same-direction candles closed and the second opened.
Reaction / Retest	An H4 candle's wick entering a Daily zone without closing through it.
Origin	The first H4 confirmation of a Daily breakout. One per breakout.
Continuation	Every later H4 alert in the same Daily direction: Daily reaction + H4 breakout, in-line breakout, Breaker, OC, engulfing.
Daily FVG	Gap left when the 3rd of three Daily candles closes without reaching the 1st; a reaction zone until a Daily close goes through it. Reacts only when price dips into it from above (rises into it, sells); a deeper FVG takes over.
H4 FVG after breakout	The H4 candle right after an in-line H4 breakout completed an FVG: a liquidity marker alert (pair + message only).
H4 External / Internal	External = the closest H4 A/V-shape before the first touch of the Daily level; anything formed after that touch is Internal.
Tolerance	The ± band (default 5 pips) used for moving away from the breaker and for a reaction failing; touches must be exact. Entry alerts use 20 pips. On crypto and Deriv synthetic indices one pip is 0.002% of price, so the 5-pip band is 0.01% of price.
Next breakout	Any later Daily break replaces the setup; a break the other way flips the bias.

Directional bias only — not financial advice. Alerts describe market direction; entries, risk and exits are your decision.
